Molecular study of apoptotic processes in *Aspergillus* ssp. and the influence of *Aspergillus fumigatus* on apoptosis in host immune effector cells

Previous results suggest that some potent fungicidals induce a type of apoptosis in *A. nidulans* similar to the caspase-independent apoptosis observed in mammalian systems. Therefore, we aim at the molecular elucidation of such events in *Aspergillus* ssp. using most modern technologies like parallel Rapid PCR, chip/array approaches or MALDI-TOF/TOF and others. Furthermore, we plan to investigate molecular mechanisms of how *Aspergillus fumigatus* suppresses the human cellular immune response via apoptosis of immune effector cells.
